Abstract

Assistive robots and embodied AI create new opportunities to support people with disabilities in physical assistance, communication, navigation, rehabilitation, and everyday life. Their usefulness depends on how people express goals, share control, understand robot behavior, and recover from failures across diverse abilities and contexts. This workshop brings together researchers and practitioners in human–robot interaction, accessibility, robotics, AI, rehabilitation, wearables, and extended reality, alongside people with lived experience of disability. We will examine how to design assistive human–robot interaction that is usable, trustworthy, adaptable, and centered on user agency. Topics include physical assistance and caregiving; accessible teleoperation and shared autonomy; speech and multimodal control; visual access and navigation; XR interfaces for robot interaction; and disability-led design and evaluation. Through paper presentations, demonstrations, a panel, small-group discussions, and collaborative synthesis, participants will compare methods and identify research questions that connect technical capabilities to people’s everyday priorities. The proposed full-day workshop will produce a public discussion summary, use-case scenarios, and a shared research agenda for accessible HRI, with opportunities for continued collaboration.

CCS Concepts

• **Human-centered computing** → **Accessibility**; • **Computer systems organization** → **Robotics**.

Keywords

Assistive robotics, accessibility, human–robot interaction, embodied AI, shared autonomy, user agency

1 Motivation and Scope

Assistive robots can support everyday activities, yet useful assistance requires more than capable autonomy: people must be able to direct, understand, and reshape that assistance [2]. Accessible

teleoperation and in-home use illustrate the importance of adapting control to individual abilities [3, 6]. Our central question is: *How can assistive robots expand people’s capabilities while preserving their agency, preferred forms of assistance, and meaningful control?*

The workshop connects technical HRI research with accessibility and disability-led design. In keeping with HRI 2027’s “Innovative HRI” theme, we treat innovation as advances in both robot interaction and the methods used to define and evaluate assistance. We address six complementary themes:

- **Physical assistance and caregiving:** feeding, manipulation, rehabilitation, and everyday tasks; comfort, consent, and safe recovery during physical interaction.
- **Accessible control and shared autonomy:** teleoperation, low-dimensional input, intervention, handoff, and personalization that preserve meaningful user control.
- **Speech and multimodal interaction:** language, gaze, gesture, switches, and wearables for expressing intent and understanding robot actions [4]; embodied support for communication [7].
- **Visual access and navigation:** accessible robot feedback, spatial information, and navigation support for blind and low-vision (BLV) people in changing environments.
- **XR for robot interaction:** accessible interfaces, simulation, and prototyping for teleoperation, intent communication, and shared control [5].
- **Disability-led design and evaluation:** lived experience, autonomy, trust, and deployment in homes and communities; success measures beyond task efficiency [1].

2 Format and Program

We propose an in-person, full-day workshop on March 8, 2027, for approximately 25–50 participants, subject to conference acceptance and scheduling. At least one organizer will attend in person. A full day allows participants to encounter systems and perspectives through talks and demos, examine cross-cutting tensions in a panel, and then develop shared questions through facilitated breakouts

and synthesis. These connected activities require time for accessible participation and exchange across disciplines.

- 09:00–09:20** Welcome, access notes, and introductions.
- 09:20–09:50** Keynote framing talk and discussion.
- 09:50–11:00** Paper session I: up to seven contributions.
- 11:00–12:00** Demonstrations and posters.
- 12:00–13:15** Lunch break.
- 13:15–14:15** Paper session II: up to six contributions.
- 14:15–15:00** Panel on agency, safety, and shared control.
- 15:00–16:00** Facilitated thematic small-group discussions.
- 16:00–16:40** Group reports and collaboration pitches.
- 16:40–17:00** Synthesis, commitments, and next steps.

Short breaks will be accommodated within session blocks. Each breakout will use a shared prompt: identify a use case, a control or access barrier, an interaction approach, and a way to evaluate it with intended users. An organizer will facilitate each group and invite written as well as spoken contributions.

3 Audience, Recruitment, and Participation

We welcome researchers, practitioners, designers, students, clinicians, and people with lived experience of disability across HRI, accessibility, robotics, AI, rehabilitation, wearables, and XR. No particular robot platform or technical prerequisite is required. We will circulate a call through the organizers' research groups, HRI and accessibility mailing lists, professional networks, and relevant community contacts, inviting both established and emerging perspectives.

Participants may propose short or long papers, position statements, or system/demo descriptions. The call will specify submission lengths, dates, and the submission route after workshop acceptance. Organizers will review contributions for relevance, clarity, and potential to stimulate discussion, seeking complementary methods and perspectives. An interest form will collect topics, demo plans, and optional access requests; participants may also contact the organizers directly. We will share accepted materials in advance with authors' permission.

We will provide readable digital materials and written activity prompts, invite access requests privately, and coordinate room and access arrangements with the conference. Demonstrations will include verbal descriptions and seated or non-hands-on participation options. Participation in photographs or recordings will be optional. No conference-supported hybrid provision is assumed.

4 Documentation and Outcomes

Each group will record its use case, open questions, evaluation priorities, and possible collaborations in a shared template. Organizers will synthesize these contributions into a discussion summary and research agenda for accessible HRI, and invite participant review before public release. The workshop website, <https://embodiedaccess.github.io>, will host consented papers, demo links, resources, and outcomes. Contributor approval will govern attribution and sharing; private access requests will not be published. We will prepare HRI's one-page archival workshop summary if accepted; participant papers will not automatically enter ACM proceedings.

5 Organizers

The team brings expertise in assistive robots, accessible interfaces, participatory design, AI, and deployment in everyday settings. Affiliations appear above; names below link to organizer email addresses. Hamza El Alaoui is the corresponding organizer.

Hamza El Alaoui is a Ph.D. student at CMU's School of Computer Science. His research focuses on cyber-physical human augmentation, combining machine learning, embedded systems, robotics, and HCI to create systems that extend human communication, perception, and physical capabilities. His work spans language technologies, multimodal sensing, human-AI integration, and accessibility systems. He previously worked on machine learning at Oracle and was a visiting scientist at Sony Computer Science Laboratories.

Harish Ram Nambiappan is an Assistant Professor at Texas A&M University. He received his Ph.D. in Computer Science from The University of Texas at Arlington. His research focuses on developing assistive navigation and robotic systems that enable BLV people to navigate dynamic indoor environments and interact directly with robots. He has built cross-modal interfaces that allow users to locate objects, direct robotic manipulation, and remain safe around moving robots and people. His broader work also includes autonomous service robots for healthcare, placing his research at the intersection of robotics, accessibility, autonomy, and HRI.

Atieh Taheri is a Presidential Postdoctoral Fellow at CMU. Her research combines accessibility, human-centered AI, mixed reality, and participatory design to build interactive systems that expand agency and creative expression for people with disabilities. Her work includes hands-free controllers, tactile interfaces, accessible conversational systems, VR experiences, and accessible generative-AI tools. She previously conducted research at Google and Apple, and earned her Ph.D. in Electrical & Computer Engineering from the University of California, Santa Barbara.

Chen Liang is a Ph.D. candidate in Computer Science & Engineering at the University of Michigan. His research develops human-AI systems that make UIs more intelligent, adaptable, and accessible. He creates AI-powered interaction proxies that translate or automate actions on users' behalf without requiring modifications to the underlying interface. He previously conducted research at Adobe.

Max Pascher is a Postdoctoral Researcher at TU Dortmund University. His research focuses on AI-enhanced human-robot collaboration, including shared-control techniques for assistive robotic arms, intervention strategies for autonomous robotic tasks, and XR-based tools for designing and evaluating human-robot interfaces. He also works on multimodal interaction and methods that keep users in control of autonomous robotic systems. He received his Ph.D. in Human-Robot Interaction from the University of Duisburg-Essen.

Vinitha Ranganeni is the Human-Robot Interaction Lead at Hello Robot, where she leads the development and real-world evaluation of human-centered software for the Stretch mobile manipulator. Her work focuses on accessible assistive robotics for people with disabilities, including customizable interfaces and in-home deployments that support greater independence. She received her Ph.D. in Computer Science from the University of Washington.

Stephanie Valencia is an Assistant Professor of Information Science at the University of Maryland. Her research focuses on equitable access to assistive technology, open-source hardware, and the design of communication systems that increase user agency and accessibility. Using participatory design, she develops AI-enabled and embodied expressive technologies for augmentative and alternative communication (AAC) users, with an emphasis on building, deploying, and rigorously evaluating systems in real-world settings. She received her Ph.D. in HCI from CMU.

Zackory Erickson is an Assistant Professor at CMU's Robotics Institute and director of the RCHI Lab. His research develops robot-learning, mobile-manipulation, sensing, and control methods for physical HRI to help older adults and people with disabilities live independently. His work spans assistance with feeding, dressing, bathing, and personal care; wearable interfaces for limited hand function; simulation; haptic perception; and safe, personalized robot autonomy. He received his Ph.D. in Robotics from Georgia Tech.

Tapomayukh Bhattacharjee is an Assistant Professor of Computer Science at Cornell University, where he directs the EmPRISE Lab. His research focuses on physical robot caregiving and physical HRI, particularly assistive robots that support people with mobility limitations in activities of daily living. His lab takes a full-stack robotics approach spanning sensing, perception, planning, learning, control, manipulation, haptic perception, and tactile sensing. He received his Ph.D. in Robotics from Georgia Tech and was a Postdoctoral Researcher at the University of Washington.

Anhong Guo is an Assistant Professor of Computer Science at the University of Michigan. His research lies at the intersection of HCI, AI, and accessibility. He develops personal assistive technologies that adapt to users' individual abilities, contexts, and intentions, particularly for BLV people. His work spans human-AI systems for accessing visual information, accessible physical and touchscreen interfaces, customizable visual-assistance tools, context-aware real-world descriptions, augmented and virtual reality, and multimodal end-user programming. He received his Ph.D. in HCI from CMU.

Eshed Ohn-Bar is an Assistant Professor of Electrical & Computer Engineering at Boston University and leads the Human-to-Everything Lab. His research develops machine-intelligence systems for embodied, assistive, and autonomous applications, spanning perception, learning, planning, control, and human-machine

interaction. His work includes accessible navigation and AI agents that provide real-time assistance to BLV people. He received his Ph.D. in Electrical Engineering from the University of California, San Diego, and was a Humboldt Fellow at the Max Planck Institute.

Jeffrey P. Bigham is an Associate Professor at CMU's Human-Computer Interaction Institute and Language Technologies Institute, where he directs the Beneficial Intelligence Group. He also serves as Director of Human-Centered Machine Intelligence & Responsible AI at Apple, leading research on AI/ML design, accessibility, and UI understanding. His research combines machine learning and human computation to develop reliable, human-centered AI systems for real-world use, particularly in accessibility. He received his Ph.D. in Computer Science from the University of Washington.
